

## **Englisch Comment Beispiel**

Nowadays, more people than ever travel by airplane because they want to go on vacation abroad or because they need to go on a business trip. This is why many people are demanding that flights should become more expensive in order to reduce emissions. In the following, I will discuss whether it would be a good idea to make flights more expensive.

It is true that airplanes cause a lot of pollution. If flights were more expensive, less people would go on vacation abroad, which would reduce emissions. In addition to that, there would also be much less noise from airplanes. This would be especially good for people who live in big cities with airports, where the constant noise of airplanes can be quite stressful.

On the other hand, less travel also means less cultural contact. This could, for example, lead to more prejudice, because people would have less contact with other cultures. Moreover, more expensive flights mean that the aviation industry makes less profit. As a result, it would not have the funds to invest in more environmentally friendly innovations. Making flights more costly would therefore be counterproductive. Lastly, making flights more expensive also increases inequality. It would mean that people of lower income classes might not be able to afford a vacation abroad. This, in turn, could also lead to more hostility between the poor and the rich due to, for example, envy.

Weighing the pros and cons, I come to the conclusion that flights should not become more expensive. Making flights more expensive would be counterproductive because it would prevent potentially environmentally-friendly innovations. On top of that, it would also fuel inequality between the poor and the rich.
